Large-Scale Deep Learning
With TensorFlow

Jeff Dean
Google Brain team
g.co/brain

In collaboration with many other people at Google
What is the Google Brain Team?

- Research team focused on long term artificial intelligence research
  - Mix of computer systems and machine learning research expertise
  - Pure ML research, and research in context of emerging ML application areas:
    - robotics, language understanding, healthcare, ...

[Link: g.co/brain]
We Disseminate Our Work in Many Ways

● By publishing our work
  ○ See papers at research.google.com/pubs/BrainTeam.html

● By releasing TensorFlow, our core machine learning research system, as an open-source project

● By releasing implementations of our research models in TensorFlow

● By collaborating with product teams at Google to get our research into real products
What Do We Really Want?

- Build artificial intelligence algorithms and systems that learn from experience
- Use those to solve difficult problems that benefit humanity
What do I mean by understanding?
What do I mean by understanding?
What do I mean by understanding?
What do I mean by understanding?

Query

[ car parts for sale ]
What do I mean by understanding?

Query

[ car parts for sale ]

Document 1

… car parking available for a small fee.
… parts of our floor model inventory for sale.

Document 2

Selling all kinds of automobile and pickup truck parts, engines, and transmissions.
Example Needs of the Future

- Which of these eye images shows symptoms of diabetic retinopathy?
- Find me all rooftops in North America
- Describe this video in Spanish
- Find me all documents relevant to reinforcement learning for robotics and summarize them in German
- Find a free time for everyone in the Smart Calendar project to meet and set up a videoconference
- Robot, please fetch me a cup of tea from the snack kitchen
Growing Use of Deep Learning at Google

Across many products/areas:
- Android
- Apps
- Drug discovery
- Gmail
- Image understanding
- Maps
- Natural language understanding
- Photos
- Robotics research
- Speech
- Translation
- YouTube
- ... many others ...
Important Property of Neural Networks

Results get better with

more data +
bigger models +
more computation

(Better algorithms, new insights and improved techniques always help, too!)
Aside

Many of the techniques that are successful now were developed 20-30 years ago

What changed? We now have:

- sufficient computational resources
- large enough interesting datasets

Use of large-scale parallelism lets us look ahead many generations of hardware improvements, as well
What do you want in a machine learning system?

- **Ease of expression**: for lots of crazy ML ideas/algorithms
- **Scalability**: can run experiments quickly
- **Portability**: can run on wide variety of platforms
- **Reproducibility**: easy to share and reproduce research
- **Production readiness**: go from research to real products
Open, standard software for general machine learning

Great for Deep Learning in particular

Google Research*

Abstract

TensorFlow [1] is an interface for expressing machine learning algorithms, and an implementation for executing such algorithms. A computation expressed using TensorFlow can be executed with little or no change on a wide variety of heterogeneous systems, ranging from mobile devices such as phones sequence prediction [47], move selection for Go [34], pedestrian detection [2], reinforcement learning [38], and other areas [17, 5]. In addition, often in close collaboration with the Google Brain team, more than 50 teams at Google and other Alphabet companies have deployed deep neural networks using DistBelief in a wide variety

TensorFlow: A system for large-scale machine learning

TensorFlow Mechanics 101

This is a technical tutorial, where we walk you through the details of using TensorFlow infrastructure to train models at scale. We use again MNIST as the example.

Convolutional Neural Networks

An introduction to convolutional neural networks using the CIFAR-10 data set. Convolutional neural nets are particularly tailored to images, since they exploit translation invariance to yield more compact and effective representations of visual content.

Vector Representations of Words

This tutorial motivates why it is useful to learn to represent words as vectors (called word embeddings). It introduces the word2vec model as an efficient method for learning embeddings. It also covers the high-level details behind noise-contrastive training methods (the biggest recent advance in training embeddings).

Recurrent Neural Networks

An introduction to RNNs, wherein we train an LSTM network to predict the next word in an English sentence. (A task sometimes called language modeling.)

Sequence-to-Sequence Models

A follow-on to the RNN tutorial, where we assemble a sequence-to-sequence model for machine translation. You will learn to build your own English-to-French translator, entirely machine learned, end-to-end.
Motivations

- DistBelief (our 1st system) was the first scalable deep learning system, but not as flexible as we wanted for research purposes
- Better understanding of problem space allowed us to make some dramatic simplifications
- Define the industrial standard for machine learning
- Short circuit the MapReduce/Hadoop inefficiency
TensorFlow: Expressing High-Level ML Computations

- Core in C++
  - Very low overhead
TensorFlow: Expressing High-Level ML Computations

- Core in C++
  - Very low overhead
- Different front ends for specifying/driving the computation
  - Python and C++ today, easy to add more
TensorFlow: Expressing High-Level ML Computations

  - Python and C++ today, easy to add more
Computation is a dataflow graph

Graph of Nodes, also called Operations or ops.
Computation is a dataflow graph

Edges are N-dimensional arrays: Tensors

- biases
- weights
- examples
- labels
- MatMul
- Add
- Relu
- Xent
Example TensorFlow fragment

- Build a graph computing a neural net inference.

```python
import tensorflow as tf
from tensorflow.examples.tutorials.mnist import input_data

mnist = input_data.read_data_sets('MNIST_data', one_hot=True)
x = tf.placeholder("float", shape=[None, 784])
W = tf.Variable(tf.zeros([784,10]))
b = tf.Variable(tf.zeros([10]))
y = tf.nn.softmax(tf.matmul(x, W) + b)
```
Computation is a dataflow graph with state

'Biases' is a variable

Some ops compute gradients

−= updates biases

biases

Add

learning rate

Mul

−=
Symbolic Differentiation

- Automatically add ops to calculate symbolic gradients of variables w.r.t. loss function.
- Apply these gradients with an optimization algorithm.

```python
y_ = tf.placeholder(tf.float32, [None, 10])
cross_entropy = -tf.reduce_sum(y_ * tf.log(y))
opt = tf.train.GradientDescentOptimizer(0.01)
train_op = opt.minimize(cross_entropy)
```
Define graph and then execute it repeatedly

- Launch the graph and run the training ops in a loop

```python
init = tf.initialize_all_variables()
sess = tf.Session()
sess.run(init)
for i in range(1000):
    batch_xs, batch_ys = mnist.train.next_batch(100)
sess.run(train_step, feed_dict={x: batch_xs, y_: batch_ys})
```
Computation is a dataflow graph
Assign Devices to Ops

- TensorFlow inserts `Send/Recv` Ops to transport tensors across devices
- `Recv` ops pull data from `Send` ops
Assign *Devices* to Ops

- TensorFlow inserts *Send/Recv* Ops to transport tensors across devices
- *Recv* ops pull data from *Send* ops
Release 0.5.0

Initial release of TensorFlow.
Release 0.6.0

Major Features and Improvements

- **Python 3.3+ support** via changes to python codebase and ability to specify python version via `./configure`.
- **Some improvements to GPU performance** and memory usage: `convnet benchmarks` roughly equivalent with native cudnn v2 performance. Improvements mostly due to moving to 32-bit indices, faster shuffling kernels. More improvements to come in later releases.

Bug Fixes

- Lots of fixes to documentation and tutorials, many contributed by the public.
- 271 closed issues on github issues.
Release 0.7.0

Major Features and Improvements

- Allow using any installed Cuda >= 7.0 and cuDNN >= R2, and add support for cuDNN R4
- Added a contrib/ directory for unsupported or experimental features, including higher level layers module
- Added an easy way to add and dynamically load user-defined ops
- Built out a good suite of tests, things should break less!
- Added MetaGraphDef which makes it easier to save graphs with metadata
- Added assignments for "Deep Learning with TensorFlow" udacity course

Bug Fixes and Other Changes

- Added a versioning framework for GraphDefs to ensure compatibility
- Enforced Python 3 compatibility
- Internal changes now show up as sensibly separated commits
- Open-sourced the doc generator
Release 0.8.0

Major Features and Improvements

- Added a distributed runtime using GRPC
- Move skflow to contrib/learn
- Better linear optimizer in contrib/linear_optimizer
- Random forest implementation in contrib/tensor_forest
- CTC loss and decoders in contrib/ctc
- Basic support for half data type
- Better support for loading user ops (see examples in contrib/)
- Allow use of (non-blocking) Eigen threadpool with TENSORFLOW_USE_EIGEN_THREADPOOL define
- Add an extension mechanism for adding network file system support
- TensorBoard displays metadata stats (running time, memory usage and device used) and tensor shapes

Big Fixes and Other Changes

- Utility for inspecting checkpoints
- Basic tracing and timeline support
- Allow building against cuDNN 5 (not incl. RNN/LSTM support)
June 2016

Release 0.9.0

Major Features and Improvements

- Python 3.5 support and binaries
- Added iOS support
- Added support for processing on GPUs on MacOS
- Added makefile for better cross-platform build support (C API only)
- fp16 support and improved complex128 support for many ops
- Higher level functionality in contrib.layers,losses,metrics,learn
- More features to Tensorboard
- Improved support for string embedding and sparse features
- The RNN api is finally "official" (see, e.g., tf.nn.dynamic_rnn, tf.nn.rnn, and the classes in tf.nn.rnn_cell).
- TensorBoard now has an Audio Dashboard, with associated audio summaries.

Big Fixes and Other Changes

- Turned on CuDNN Autotune.
- Added support for using third-party Python optimization algorithms (contrib.opt).
- Google Cloud Storage filesystem support.
- HDF5 support
Activity

- 6,007 commits
- 10 branches
- 9 releases
- 316 contributors

Contributions to master, excluding merge commits
Experiment Turnaround Time and Research Productivity

- **Minutes, Hours:**
  - Interactive research! Instant gratification!

- **1-4 days**
  - Tolerable
  - Interactivity replaced by running many experiments in parallel

- **1-4 weeks**
  - High value experiments only
  - Progress stalls

- **>1 month**
  - Don’t even try

2.6 hours vs. 79.3 hours (30.5X)

1 GPU

10 GPUs

50 GPUs

Hours
Sync converges faster (time to accuracy)

Synchronous updates (with backup workers) trains to higher accuracy faster
Better scaling to more workers (less loss of accuracy)

Sync converges faster (time to accuracy)

40 hours vs. 50 hours

Synchronous updates (with backup workers) trains to higher accuracy faster
Better scaling to more workers (less loss of accuracy)

General Computations

Although we originally built TensorFlow for our uses around deep neural networks, it’s actually quite flexible.

Wide variety of machine learning and other kinds of numeric computations easily expressible in the computation graph model.
Runs on Variety of Platforms

phones

**distributed systems** of 100s of machines and/or GPU cards

single machines (CPU and/or GPUs) ...

custom ML hardware
Trend: Much More Heterogeneous hardware

General purpose CPU performance scaling has slowed significantly

Specialization of hardware for certain workloads will be more important
Tensor Processing Unit

Custom machine learning ASIC

In production use for >16 months: used on every search query, used for AlphaGo match, ...

Long Short-Term Memory (LSTMs): Make Your Memory Cells Differentiable
[Hochreiter & Schmidhuber, 1997]
Example: LSTM [Hochreiter et al, 1997][Gers et al, 1999]

\[
i_t = W_{ix}x_t + W_{ih}h_{t-1} + b_i \\
j_t = W_{jx}x_t + W_{jh}h_{t-1} + b_j \\
f_t = W_{fx}x_t + W_{fh}h_{t-1} + b_f \\
o_t = W_{ox}x_t + W_{oh}h_{t-1} + b_o \\
c_t = \sigma(f_t) \odot c_{t-1} + \sigma(i_t) \odot \tanh(j_t) \\
\]

\[
h_t = \sigma(o_t) \odot \tanh(c_t) \\
\]

Enables long term dependencies to flow

\[
def __call__(self, inputs, state, scope=None):
    """Long short-term memory cell (LSTM)."""
    with vs.variable_scope(scope or type(self).__name__):  # "BasicLSTMCell"
        # Parameters of gates are concatenated into one multiply for efficiency.
        c, h = array_ops.split(1, 2, state)
        concat = linear([inputs, h], 4 * self._num_units, True)
        i, j, f, o = array_ops.split(1, 4, concat)
        new_c = c * sigmoid(f + self._forget_bias) + sigmoid(i) * tanh(j)
        new_h = tanh(new_c) * sigmoid(o)
        return new_h, array_ops.concat(1, [new_c, new_h])
\]
Example: LSTM

for i in range(20):
    m, c = LSTMCell(x[i], mprev, cprev)
    mprev = m
    cprev = c
Example: Deep LSTM

for i in range(20):
    for d in range(4):  # d is depth
        input = x[i] if d is 0 else m[d-1]
        m[d], c[d] = LSTMCell(input, mprev[d], cprev[d])
        mprev[d] = m[d]
        cprev[d] = c[d]
for i in range(20):
    for d in range(4): # d is depth
        input = x[i] if d is 0 else m[d-1]
        m[d], c[d] = LSTMCell(input, mprev[d], cprev[d])
        mprev[d] = m[d]
        cprev[d] = c[d]
Example: Deep LSTM

for i in range(20):
    for d in range(4):  # d is depth
        with tf.device("/gpu:%d" % d):
            input = x[i] if d is 0 else m[d-1]
            m[d], c[d] = LSTMCell(input, mprev[d], cprev[d])
            mprev[d] = m[d]
            cprev[d] = c[d]

Google’s AI just cracked the game that supposedly no computer could beat

By Mike Murphy | January 27, 2016

Google achieves AI 'breakthrough' at Go

An artificial intelligence program developed by Google beats Europe's top player at the ancient Chinese game of Go, about a decade earlier than expected.

© 27 January 2016 | Technology

How did they do it?
What is the game Go?
Facebook trains AI to beat humans at Go

Google is now starting to encroach on activities we previously thought only a brilliantly sophisticated human brain could handle. In 1997, Deep Blue, a supercomputer beat Grand Master Garry Kasparov at chess in 1997, and in 2011 IBM's Watson beat former human winners at the quiz game Jeopardy. But the ancient board game Go has long been one of the major goals of artificial intelligence research. It's understood to be one of the most difficult games for computers to handle due to the sheer number of possible moves a player can make at any given point. Until now, that is.

Combining Vision with Robotics

“Learning Hand-Eye Coordination for Robotic Grasping with Deep Learning and Large-Scale Data Collection”, Sergey Levine, Peter Pastor, Alex Krizhevsky, & Deirdre Quillen, Arxiv, arxiv.org/abs/1603.02199
How Can You Get Started with Machine Learning?

Three ways, with varying complexity:

(1) Use a Cloud-based API (Vision, Speech, etc.)
(2) Use an existing model architecture, and retrain it or fine tune on your dataset
(3) Develop your own machine learning models for new problems

More flexible, but more effort required
Use Cloud-based APIs

**GOOGLE TRANSLATE API**
Dynamically translate between thousands of available language pairs
[cloud.google.com/translate](http://cloud.google.com/translate)

**CLOUD SPEECH API**
Speech to text conversion powered by machine learning
[cloud.google.com/speech](http://cloud.google.com/speech)

**CLOUD VISION API**
Derive insight from images with our powerful Cloud Vision API
[cloud.google.com/vision](http://cloud.google.com/vision)

**CLOUD TEXT API**
Use Cloud Text API for sentiment analysis and entity recognition in a piece of text.

CLOUD MACHINE LEARNING ALPCHA
Machine Learning on any data, of any size
SIGN UP FOR THE LIMITED PREVIEW

Managed scalable machine learning platform

Google Cloud Machine Learning is a managed platform that enables you to easily build machine learning models, that work on any type of data, of any size. Create your model with the powerful TensorFlow framework, that powers many Google products from Google Photos, to Google Cloud Speech. Build models of any size with our
A Few TensorFlow Community Examples

...
Reinforcement Learning using Tensor Flow

Quick start

Check out Karpathy game in notebooks folder.

The image above depicts a strategy learned by the DeepQ controller. Available actions are accelerating top, bottom, left or right. The reward signal is +1 for the greenfellas, -1 for red and -5 for orange.
"Neural Art" in TensorFlow

An implementation of "A neural algorithm of Artistic style" in TensorFlow, for

- Introductory, hackable demos for TensorFlow, and
- Demonstrating the use of importing various Caffe cnn models (VGG and illustration2vec) in TF.

In this work, I put effort in putting the code simple as possible, for being a good introductory code to TF. For this reason, I also implemented very basic uses of TensorBoard (the visualizer). I also aimed on demonstrating the use of importing various Caffe models from *.caffemodel files into TensorFlow, especially models that seemed not to be imported by anybody yet in TF (as far as I know). Based on https://github.com/ethereon/caffe-tensorflow, I modified the importer so that it can import illustration2vec (http://illustration2vec.net/), which is another CNN available as a Caffe model. Using different CNNs yields different results, which reflects the characteristics of the model.

In the Neural Art problem setting, the weights of the CNN are fixed, and the input image into the CNN is the only "trainable" variable, making the code easy to understand (the optimized/trained image is the output image). I hope this example serves as a good introduction to TensorFlow as well as for entertainment purposes.
github.com/sherjilozair/char-rnn-tensorflow

char-rnn-tensorflow

Multi-layer Recurrent Neural Networks (LSTM, RNN) for character-level language models in Python using Tensorflow.

Inspired from Andrej Karpathy's char-rnn.

Requirements

- Tensorflow

Basic Usage

To train with default parameters on the tinyshakespeare corpus, run python train.py.

To sample from a checkpointed model, python sample.py.
Keras: Deep Learning library for Theano and TensorFlow

You have just found Keras.

Keras is a minimalist, highly modular neural networks library, written in Python and capable of running either on top of either TensorFlow or Theano. It was developed with a focus on enabling fast experimentation. Being able to go from idea to result with the least possible delay is key to doing good research.

Use Keras if you need a deep learning library that:

- allows for easy and fast prototyping (through total modularity, minimalism, and extensibility).
- supports both convolutional networks and recurrent networks, as well as combinations of the two.
- supports arbitrary connectivity schemes (including multi-input and multi-output training).
- runs seamlessly on CPU and GPU.

Read the documentation at Keras.io.

Keras is compatible with: - **Python 2.7-3.5** with the Theano backend - **Python 2.7** with the TensorFlow backend
Neural Caption Generator

  - Borrowed some code and ideas from Andrej Karpathy’s NeuralTalk.
- You need flickr30k data (images and annotations)

Code

- make_flickr_dataset.py : Extracting feats of flickr30k images, and save them in './data/feats.npy'
- model_tensorflow.py : TensorFlow Version
- model_theano.py : Theano Version

Usage

- Flickr30k Dataset Download
- Extract VGG Features of Flicker30k images (make_flickr_dataset.py)
- Train: run train() in model_tensorflow.py or model_theano.py
- Test: run test() in model_tensorflow.py or model_theano.py.
  - parameters: VGG FC7 feature of test image, trained model path

缘起

2015年11月9日，Google 官方在其博客上称，Google Research 宣布推出第二代机器学习系统 TensorFlow，针对先前的 DistBelief 的短板有了各方面的加强，更重要的是，它是开源的，任何人都可以用。

机器学习作为人工智能的一种类型，可以让软件根据大量的数据来对未来的情况进行阐述或预判。如今，领先的科技巨头无不在这机器学习下予以极大投入。Facebook、苹果、微软，甚至国内的百度。Google 自然也在其中。「TensorFlow」是 Google
What Does the Future Hold?

Deep learning usage will continue to grow and accelerate:

- Across more and more fields and problems:
  - robotics, self-driving vehicles, ...
  - health care
  - video understanding
  - dialogue systems
  - personal assistance
  - ...
Conclusions

Deep neural networks are making significant strides in understanding:
In speech, vision, language, search, robotics, ...

If you’re not considering how to use deep neural nets to solve your vision or understanding problems, you almost certainly should be
